

Cloud backup

The use-case of this solution is very similar to [Syncthing](#), but the goal here is to utilize cloud storage (OneDrive, Google Drive, Dropbox, etc.) to back up your data. The important difference is that this is **upload only** - you can't use this solution to synchronize data between different devices. It is for continuously copying your data to the cloud, so in case of a hardware failure/loss, you can restore your previous Batocera installation with ease.

This solution uses [rclone](#), which is shipped with Batocera and [Batocera's services feature](#). Because of the latter, it requires **v40**.

You can find a detailed description of how this works and setup instructions for it in [this repository](#).
