Evmapy

Evmapy is a tool used by Batocera to map inputs from the controller to a virtual keyboard (although, its capable of quite a bit more than that). Refer to evmapy's readme for more information. This is primarily used to enable the use of the emulator's shortcuts if it does not natively support hotkey binding onto the controller's buttons (for example, Dolphin does not use evmapy).

The emulator's “keys” file, if used, is located at `package/batocera/<emulators or ports>/<emulator or port>/<system shortname>.<emulator>.keys`. This file must then be copied from `$(BR2_EXTERNAL_BATOCERA_PATH)/package/batocera/<emulators or ports>/<emulator or port>/<system shortname>.<emulator>.keys` to `$(TARGET_DIR)/usr/share/evmapy` in its makefile. For example, with Citra (the 3DS emulator):

citra.mk

```
define CITRA_EVMAP
    # Create the directory if it doesn't already exist.
    mkdir -p $(TARGET_DIR)/usr/share/evmapy
    # Copy, while making all the parent folders, the keys file to the
correct location.
    cp -prn
$(BR2_EXTERNAL_BATOCERA_PATH)/package/batocera/emulators/citra/3ds.citr
a.keys \
        $(TARGET_DIR)/usr/share/evmapy
endef

CITRA_POST_INSTALL_TARGET_HOOKS = CITRA_EVMAP
```

Evmapy uses a simple syntax for its events, and indentation/spacing is not enforced (but it's still recommended for readability). First, everything must be inside of a curly bracket:

```
{
```

then the controller defined. In Batocera, defining this as “`actions_player1`” will automatically use whichever controller is currently assigned to player 1. Then, its triggers and actions are contained within a square bracket:

```
    "actions_player1": [
```

From there on, every trigger and action is contained inside of another curly bracket. For instance:

```
        {
            "trigger": ["hotkey", "start"],
            "type": "key",
            "target": ["KEY_LEFTCTRL", "KEY_Q"],
            "description": "Exit emulator"
        },
```

and additional trigger and actions are separated by commas, like a list, until the last one is reached and the remaining brackets are closed off:

```
        {
            "trigger": "r3",
            "type": "key",
            "target": "BTN_LEFT",
            "description": "Mouse Click"
        }
    ]
}
```

Input triggers

Batocera uses `es_input`'s generic terms to refer to its controller's inputs. Though not everything is intuitive, is a list of the human-readable inputs against the "`trigger`" code they use in the keys file:

Input	**Trigger name**
[HOTKEY]	`hotkey`
[START]	`start`
[SELECT]	`select`
	`b`
	`a`
	`y`
	`x`
D-pad Down	`down`
D-pad Right	`right`
D-pad Up	`up`
D-pad Left	`left`
All left analog stick movement	`joystick1`
All right analog stick movement	`joystick2`
LS Down	`joystick1down`
LS Right	`joystick1right`
LS Up	`joystick1up`
LS Left	`joystick1left`
RS Down	`joystick2down`
RS Right	`joystick2right`
RS Up	`joystick2up`
RS Left	`joystick2left`
[L1]	`pageup`
[R1]	`pagedown`
[L2]	`l2`
[R2]	`r2`
[L3] (LS click-in)	`l3`
[R3] (RS click-in)	`r3`

This is but the tip of the iceberg of events that evmapy can parse. Refer to its documentation for more details.

Output events

Keys

The bread and butter of events evmapy will be sending out. Type in the name of the key desired to be pressed. If multiple keys are needed, separate them with commas in a list.

The most common modifier keys: KEY_LEFTCTRL, KEY_LEFTSHIFT, KEY_LEFTALT, KEY_RIGHTSHIFT, KEY_ENTER, KEY_PAGEDOWN, etc.

The most common exit shortcuts are [“KEY_LEFTALT”, “KEY_F4”] and [“KEY_LEFTCTRL”, “KEY_Q”].

Here's a sample of the /usr/include/linux/input-event-codes.h file from a standard installation of Solus. This should cover all the possible output events that can be handled by evmapy.

 * Some keyboards have keys which do not have a defined meaning, these
keys
 * are intended to be programmed / bound to macros by the user. For
most
 * keyboards with these macro-keys the key-sequence to inject, or
action to
 * take, is all handled by software on the host side. So from the
```

```
kernel's
 * point of view these are just normal keys.
 *
 * The KEY_MACRO# codes below are intended for such keys, which may be
labeled
 * e.g. G1-G18, or S1 - S30. The KEY_MACRO# codes MUST NOT be used for
keys
 * where the marking on the key does indicate a defined meaning /
purpose.
 *
 * The KEY_MACRO# codes MUST also NOT be used as fallback for when no
existing
 * KEY_FOO define matches the marking / purpose. In this case a new
KEY_FOO
 * define MUST be added.

Execute

In case the emulator in question supports no keyboard shortcuts to perform actions, evmapy is capable of running commands directly. This should only be used as a last-resort, and typically only to kill the emulator.

To execute a command instead of pressing a key, replace the type “key” with “exec”, then type out the desired command enclosed in quotation marks as the target. For example, from the Sonic Retro engines (which do not feature keyboard shortcuts):

```
    {
            "trigger": ["hotkey", "start"],
            "type": "exec",
            "target": "killall -9 sonic2013; killall -9 soniccd"
    }
```
