validate images

The list of images not yet released and still in validation : https://batocera.org/download_table

for each image to release

- update, and check you're in the updated version
- check minimum 3 emulators including retroarch
- check audio is working
- check eventually kodi
- maximum validation duration : 10 minutes

The aim of validation is not to discover bugs. This was the aim of the previous builds.

The aim is to validate that the last build image works correctly : aka booting, and minimal function to avoid release a corrupted image.

prepare images links on the mirror server for faster downloads

update x86_64, rpi images on the mirror.

release some images

```
# connect on mirrors.o2switch.fr
1) ./doRelease.sh rk3326 39
2) ./listInstalls.sh # update list of install files (to install from
batocera) (https://mirrors.o2switch.fr/batocera/installs.txt)

# on the website
3) ./updateImages.sh
```

update the changelog

```
# generate and copy the changelog on the website (remove any lines from the
next version already present)
~/git/batocera.linux$ python3 ./scripts/linux/convertChangelog.py <
./batocera-Changelog.md > changelog-content.html
```

update the last version file

```
includes/config.php
```

add new boards

see images/download and include/boards.php to add some new boards on the website.
