

Future Pinball

Future Pinball is a pinball simulator, written for Windows, and running in Batocera Linux through Wine. That's a reason why it is only available for Batocera PC.

It's a simulator for both original tables and re-creations of existing physical pinball tables, using Microsoft Visual Basic to implement all the table logic. The physics and overall graphics of Future Pinball make it feel closer to a physical pinball than an arcade game, as it's usually the case with pinball games that are available with console emulators.

All 3D graphics objects are rendered in real time, and you can change the view point at any given time (see controls below). As a consequence, it requires a PC with sufficient GPU power. It can still run well on recent Intel integrated GPUs.

Tables

Future Pinball tables are distributed as .fpt files. In many cases, a pinball table is fully contained in the .fpt file, but for some tables, you need additional files (fonts, music) that are distributed as side '.fpl' files, sitting next to the .fpt file.

The .fpt file is the main one that is loaded by Batocera to start your pinball game. Just put it into the /userdata/roms/fpinball directory. You can store tables in their own sub-folders if you wish.

Controls

Button	Action
Select	insert coin
Start	start game / add player
L1	left flipper
R1	right flipper

Button	Action
South	ball launcher
West	change camera view
East	Look up to the backglass
North	Pause / High scores
D-Pad	Shake the pinball (left, right, up/front)
Hotkey + start	Quit, as usual
